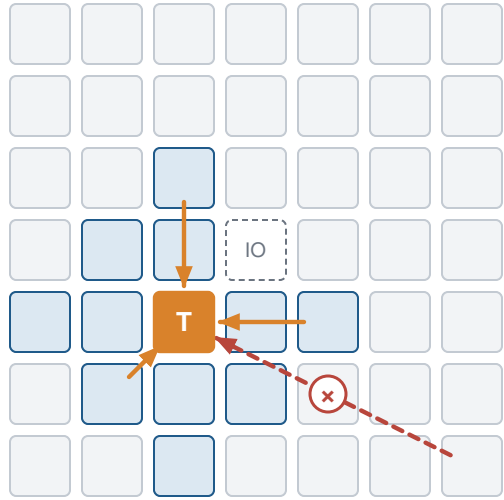
(a) Per-GPM busy time: static split vs. stealing

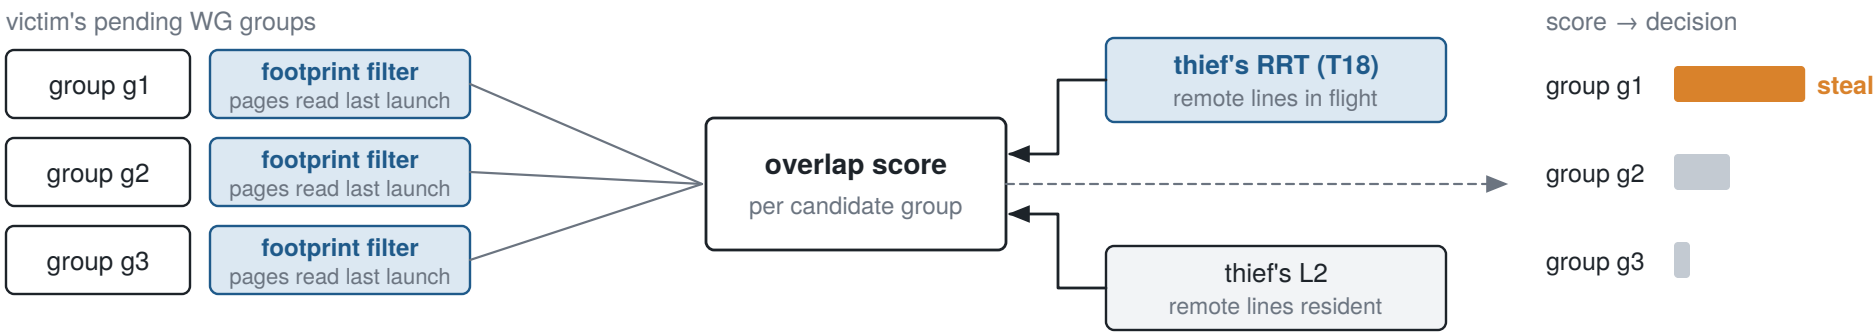
(b) Steal only from neighbors within 2 hops



T = GPM that finished early; shaded = within 2 hops

a far victim's WGs would pay 5–10 extra hops per remote access

(c) Which pending WG group to steal: footprint filters



Footprint filters are cuckoo filters, so stale pages can be deleted when a group's footprint changes. Without history, fall back to the adjacent / same-group WGs. The thief's RRT is the same table that T18 uses for merging.
